1 Untyped lambda calculus

This document describes the untyped lambda-calculus, with the following grammar. References are to definitions in Barendregt, “The Lambda Calculus: Its Syntax and Semantics”.

tm, t, u, v, w	$::=$	terms
	$ $	x variables
	$ $	$\lambda x.t$ abstractions
	$ $	$t\ u$ function application, list indexing
	$ $	k
	$ $	add
	$ $	nil
	$ $	t, u

In β -reduction, the argument of an application is substituted for the bound variable in an abstraction. We use the $t[x \rightsquigarrow u]$ notation for substituting the term u for the variable x in the term t .

t β -reduces to u

(Definition 3.1.3)

<div>BETA-REDUCT</div> <div>$\frac{\text{value } v}{(\lambda x.t)\ v\ \beta\text{-reduces to } t[x \rightsquigarrow v]}$</div>	<div>BETA-APP-0</div> <div>$\frac{\text{value } (v, w)}{(v, w)\ 0\ \beta\text{-reduces to } t}$</div>
<div>BETA-APP-K</div> <div>$\frac{\text{value } (v, w)}{(v, w)\ (1 + k)\ \beta\text{-reduces to } (w\ k)}$</div>	<div>BETA-PLUS</div> <div>$\frac{\text{add } (j, (k, \text{nil}))}{\text{add } (j, (k, \text{nil}))\ \beta\text{-reduces to } (j + k)}$</div>

We can define a deterministic, small-step evaluation relation by reducing in the heads of applications. This is a *call-by-name* semantics and performs head-reduction.

$$\boxed{t \rightsquigarrow t'} \quad (\text{Small-step evaluation})$$

$$\begin{array}{c}
\text{S-APP1} \\
\frac{t \rightsquigarrow t'}{t \ u \rightsquigarrow t' \ t}
\end{array}
\quad
\begin{array}{c}
\text{S-BETA} \\
\frac{}{(\lambda x. t) \ u \rightsquigarrow t[x \rightsquigarrow u]}
\end{array}
\quad
\begin{array}{c}
\text{S-CONS1} \\
\frac{t \rightsquigarrow t'}{t, u \rightsquigarrow t', t}
\end{array}
\quad
\begin{array}{c}
\text{S-CONS2} \\
\frac{t \rightsquigarrow t' \quad \mathbf{value} \ v}{v, t \rightsquigarrow v, t'}
\end{array}$$

$$\begin{array}{c}
\text{S-PRJ-ZERO} \\
\frac{\mathbf{value} \ (v, w)}{(v, w) \ 0 \rightsquigarrow v}
\end{array}
\quad
\begin{array}{c}
\text{S-PRJ-SUC} \\
\frac{\mathbf{value} \ (v, w)}{(v, w) \ (1 + k) \rightsquigarrow (v, w) \ k}
\end{array}
\quad
\begin{array}{c}
\text{S-ADD} \\
\frac{}{\mathbf{add} \ (k_1, k_2) \rightsquigarrow k_1 + k_2}
\end{array}$$

We can also define a nondeterministic single-step full-reduction by performing β -reduction in any subterm. Iterating this reduction will convert a term into its β -normal form.

$$\boxed{t \longrightarrow_{\beta} u} \quad (\text{Full CBV } \beta\text{-reduction})$$

$$\begin{array}{c}
\text{F-BETA} \\
\frac{\mathbf{value} \ v}{(\lambda x. t) \ v \longrightarrow_{\beta} t[x \rightsquigarrow v]}
\end{array}
\quad
\begin{array}{c}
\text{F-ABS} \\
\frac{t \longrightarrow_{\beta} t'}{\lambda x. t \longrightarrow_{\beta} \lambda x. t'}
\end{array}
\quad
\begin{array}{c}
\text{F-APP1} \\
\frac{t \longrightarrow_{\beta} t'}{t \ u \longrightarrow_{\beta} t' \ u}
\end{array}$$

$$\begin{array}{c}
\text{F-APP2} \\
\frac{u \longrightarrow_{\beta} u'}{t \ u \longrightarrow_{\beta} t \ u'}
\end{array}
\quad
\begin{array}{c}
\text{F-CONS1} \\
\frac{t \longrightarrow_{\beta} t'}{t, u \longrightarrow_{\beta} t', u}
\end{array}
\quad
\begin{array}{c}
\text{F-CONS2} \\
\frac{u \longrightarrow_{\beta} u'}{t, u \longrightarrow_{\beta} t, u'}
\end{array}
\quad
\begin{array}{c}
\text{F-PRJ-ZERO} \\
\frac{\mathbf{value} \ v \quad \mathbf{listvalue} \ w}{(v, w) \ 0 \longrightarrow_{\beta} v}
\end{array}$$

$$\begin{array}{c}
\text{F-PRJ-SUC} \\
\frac{\mathbf{value} \ v \quad \mathbf{listvalue} \ w}{(v, w) \ (1 + k) \longrightarrow_{\beta} w \ k}
\end{array}
\quad
\begin{array}{c}
\text{F-ADD} \\
\frac{}{\mathbf{add} \ (k_1, (k_2, \mathbf{nil})) \longrightarrow_{\beta} k_1 + k_2}
\end{array}$$

We can define when two terms are equivalent up to β .

$$\boxed{t \equiv_{\beta} u} \quad (\beta\text{-conversion or } \beta\text{-equality (Definition 2.1.4)})$$

$$\begin{array}{c}
\text{EQ-BETA} \\
\frac{}{(\lambda x. t) \ u \equiv_{\beta} t[x \rightsquigarrow u]}
\end{array}
\quad
\begin{array}{c}
\text{EQ-REFL} \\
\frac{}{t \equiv_{\beta} t}
\end{array}
\quad
\begin{array}{c}
\text{EQ-SYM} \\
\frac{u \equiv_{\beta} t}{t \equiv_{\beta} u}
\end{array}
\quad
\begin{array}{c}
\text{EQ-TRANS} \\
\frac{t_1 \equiv_{\beta} t_2 \quad t_2 \equiv_{\beta} t_3}{t_1 \equiv_{\beta} t_3}
\end{array}$$

$$\begin{array}{c}
\text{EQ-APP1} \\
\frac{t \equiv_{\beta} t'}{t \ u \equiv_{\beta} t' \ u}
\end{array}
\quad
\begin{array}{c}
\text{EQ-APP2} \\
\frac{u \equiv_{\beta} u'}{t \ u \equiv_{\beta} t \ u'}
\end{array}
\quad
\begin{array}{c}
\text{EQ-ABS} \\
\frac{t \equiv_{\beta} t'}{\lambda x. t \equiv_{\beta} \lambda x. t'}
\end{array}
\quad
\begin{array}{c}
\text{EQ-CONS1} \\
\frac{t \equiv_{\beta} t'}{t, u \equiv_{\beta} t', u}
\end{array}$$

$$\begin{array}{c}
\text{EQ-CONS2} \\
\frac{u \equiv_{\beta} u'}{t, u \equiv_{\beta} t, u'}
\end{array}$$

Finally, the Church-Rosser Theorem relies on the definition of parallel reduction. This is a version of reduction that is confluent.

$$\boxed{t \Longrightarrow_{\beta} u} \quad (\text{Parallel reduction (3.2.3)})$$

$$\begin{array}{c}
\text{P-BETA} \\
\frac{t \Longrightarrow_{\beta} \lambda x.t' \quad u \Longrightarrow_{\beta} v \quad \mathbf{value} \ v}{t \ u \Longrightarrow_{\beta} t'[x \rightsquigarrow v]}
\end{array}
\quad
\begin{array}{c}
\text{P-APP-K} \\
\frac{t \Longrightarrow_{\beta} v \quad u \Longrightarrow_{\beta} k \quad \mathbf{value} \ v \quad \mathbf{nth} \ v \ k = w}{t \ u \Longrightarrow_{\beta} w}
\end{array}
\quad
\begin{array}{c}
\text{P-ADD-BETA} \\
\frac{t \Longrightarrow_{\beta} j, (k, \mathbf{nil})}{\mathbf{add} \ t \Longrightarrow_{\beta} (j + k)}
\end{array}$$

$$\begin{array}{c}
\text{P-VAR} \\
\frac{}{x \Longrightarrow_{\beta} x}
\end{array}
\quad
\begin{array}{c}
\text{P-ABS} \\
\frac{t \Longrightarrow_{\beta} t'}{\lambda x.t \Longrightarrow_{\beta} \lambda x.t'}
\end{array}
\quad
\begin{array}{c}
\text{P-APP} \\
\frac{t \Longrightarrow_{\beta} t' \quad u \Longrightarrow_{\beta} u'}{t \ u \Longrightarrow_{\beta} t' \ u'}
\end{array}
\quad
\begin{array}{c}
\text{P-CONS} \\
\frac{t \Longrightarrow_{\beta} t' \quad u \Longrightarrow_{\beta} u'}{t, u \Longrightarrow_{\beta} t', u'}
\end{array}$$

$$\begin{array}{c}
\text{P-NIL} \\
\frac{}{\mathbf{nil} \Longrightarrow_{\beta} \mathbf{nil}}
\end{array}
\quad
\begin{array}{c}
\text{P-ADD} \\
\frac{}{\mathbf{add} \Longrightarrow_{\beta} \mathbf{add}}
\end{array}
\quad
\begin{array}{c}
\text{P-NAT} \\
\frac{}{k \Longrightarrow_{\beta} k}
\end{array}$$

2 Relation operations

Many of the operations above can be generated by applying the following closure operations to the β reduction relation. These operations are parameterized by an arbitrary relation R .

Note that $t \rightarrow_R u$ with R equal to β is the same relation as $t \rightarrow_{\beta} u$. And, the compatible, reflexive, symmetric and transitive closure of β is the same relation as $t \equiv_{\beta} u$.

$$\boxed{t \rightarrow_R u} \quad (\text{Compatible closure of } R \text{ (aka one-step reduction (3.1.5))})$$

$$\begin{array}{c}
\text{CC-REL} \\
\frac{R \ t \ u}{t \rightarrow_R u}
\end{array}
\quad
\begin{array}{c}
\text{CC-ABS} \\
\frac{t \rightarrow_R u}{\lambda x.t \rightarrow_R \lambda x.u}
\end{array}
\quad
\begin{array}{c}
\text{CC-APP1} \\
\frac{t \rightarrow_R t'}{t \ u \rightarrow_R t' \ u}
\end{array}
\quad
\begin{array}{c}
\text{CC-APP2} \\
\frac{u \rightarrow_R u'}{t \ u \rightarrow_R t \ u'}
\end{array}$$

$$\begin{array}{c}
\text{CC-CONS1} \\
\frac{t \rightarrow_R t'}{t, u \rightarrow_R t', u}
\end{array}
\quad
\begin{array}{c}
\text{CC-CONS2} \\
\frac{u \rightarrow_R u'}{t, u \rightarrow_R t, u'}
\end{array}$$

$$\boxed{t \rightarrow_{\overline{\overline{R}}} u} \quad (\text{reflexive closure of } R \text{ (3.1.4)})$$

$$\begin{array}{c}
\text{R-REL} \\
\frac{R \ t \ u}{t \rightarrow_{\overline{\overline{R}}} u}
\end{array}
\quad
\begin{array}{c}
\text{R-REFL} \\
\frac{}{t \rightarrow_{\overline{\overline{R}}} t}
\end{array}$$

$$\boxed{t \rightarrow_R^+ u} \quad (\text{transitive closure of } R \text{ (3.1.4)})$$

$$\begin{array}{c} \text{T-REL} \\ \frac{R t u}{t \rightarrow_R^+ u} \end{array} \quad \begin{array}{c} \text{T-TRANS} \\ \frac{t_1 \rightarrow_R^+ t_2 \quad t_2 \rightarrow_R^+ t_3}{t_1 \rightarrow_R^+ t_3} \end{array}$$

$$\boxed{t \rightarrow_R^* u} \quad (\text{reflexive-transitive closure of } R)$$

$$\begin{array}{c} \text{RT-REL} \\ \frac{R t u}{t \rightarrow_R^* u} \end{array} \quad \begin{array}{c} \text{RT-REFL} \\ \frac{}{t \rightarrow_R^* t} \end{array} \quad \begin{array}{c} \text{RT-TRANS} \\ \frac{t_1 \rightarrow_R^* t_2 \quad t_2 \rightarrow_R^* t_3}{t_1 \rightarrow_R^* t_3} \end{array}$$

$$\boxed{t \leftrightarrow_R u} \quad (\text{symmetric-transitive closure of } R)$$

$$\begin{array}{c} \text{ST-REL} \\ \frac{R t u}{t \leftrightarrow_R u} \end{array} \quad \begin{array}{c} \text{ST-SYM} \\ \frac{u \leftrightarrow_R t}{t \leftrightarrow_R u} \end{array} \quad \begin{array}{c} \text{ST-TRANS} \\ \frac{t_1 \leftrightarrow_R t_2 \quad t_2 \leftrightarrow_R t_3}{t_1 \leftrightarrow_R t_3} \end{array}$$

3 Eta-reduction

By changing the definition of the underlying primitive reduction, we can also reason about η -reduction and $\beta\eta$ -equivalence. Note that the rule for η -reduction has been stated in a way that generates the appropriate output for the locally-nameless representation in Coq. In this output, the fact that $x \notin \text{fv}t$ is implicit and does not need to be added as a precondition to the rule.

$$\boxed{t \text{ } \eta\text{-reduces to } u} \quad (\text{Definition 3.1.1 (i)})$$

$$\begin{array}{c} \text{ETA-REDUCT} \\ \frac{t' = t x}{\lambda x. t' \text{ } \eta\text{-reduces to } t} \end{array}$$

$$\boxed{t \text{ } \beta\eta\text{-reduces to } u} \quad (\text{Either } \beta \text{ or } \eta \text{ reduction (Definition 3.1.1 (ii))})$$

$$\begin{array}{c} \text{ETA-BETA} \\ \frac{t \text{ } \beta\text{-reduces to } u}{t \text{ } \beta\eta\text{-reduces to } u} \end{array} \quad \begin{array}{c} \text{ETA-ETA} \\ \frac{t \text{ } \eta\text{-reduces to } u}{t \text{ } \beta\eta\text{-reduces to } u} \end{array}$$
